makan

What should I order *here?*

Makan answers from real meals people saved and chose again, and says how sure it is. Free for diners; restaurants can never pay to change the answer.

TigerLaunch 2026 · Imperial College London

Nasi goreng, Papi Chulo, Pererenan · saved on Makan

The menu is open. What do you order?

67%

of UK adults say they get “menu anxiety”. Among 18–24-year-olds it’s 86%, and about a third let someone else order.

Maps, delivery apps and TikTok help you choose the restaurant. Makan is for the next moment, at the table, somewhere you’ve never eaten.

2023 survey of about 2,000 UK adults for Prezzo, as reported in the press; the original was not found.

Brands

sponsored area boards

A sponsor's name sits on the board; it never changes what the board ranks. Planned, not built.

£111m a year in restaurant fees if every venue in the UK, five large EU markets and Indonesia sat in a mature Makan area. A ceiling, not a forecast: restaurants already pay for being found, and Indonesian venues spend US$110–130m a year on delivery-app ads.

Months count from funding, planned by April 2027. No restaurant has paid yet; prices are untested. Source: Makan business model, October 2026.

Why Makan can hold the corner nobody holds

1

Evidence others can’t make up

Repeat choices between a diner’s own meals. AI in Google Maps and ChatGPT can summarise reviews; it can’t know what a person chose again.

2

No conflict in the answer

Platforms paid by the restaurants they rank can’t credibly say “order this, not that”. Since April 2025 UK law fines concealed incentivised reviews; Makan’s seeders say they’re paid in their bio, and nobody is paid for a rating.

3

A density method, not a directory

Directories died when content went stale. Makan seeds one small area to a measurable line, keeps it fresh, and measures when diners take over.

4

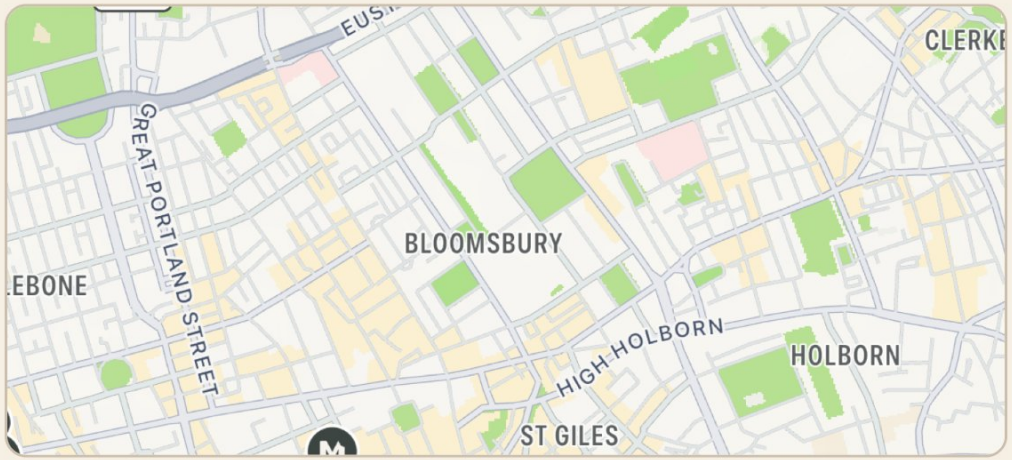

Two markets from day one

Beli ranks restaurants, not dishes, and isn’t in Southeast Asia; Indonesia’s platforms aren’t in Europe. Makan already works in English and Bahasa Indonesia.

The moat is the evidence: every dense area adds repeat choices nobody else holds, and the answer stays one restaurants can’t buy.

London: Bloomsbury

About 150 venues between UCL and SOAS. Devon works it on foot, with two student ambassadors at the London Living Wage.

57,700 students at UCL and SOAS, whose main campuses sit here

Tests whether the method works and UK venues pay

Jakarta: around BINUS

About 150 venues in the student belt. Local seeders at the Jakarta minimum-wage rate, coordinated through Jawasoft.

£56

to cover one venue, against £139 in London

£5.9k to seed 1,800 dish observations, against £14.6k in London

Tests Gen Z demand in the long-term market
